

LASIK

LASIK, a form of refractive surgery, is an option for vision correction without needing to wear glasses or contact lenses. Simply put, LASIK reshapes the cornea with a laser.

Recently, other surgical alternatives have become available. Among these is a technique called phakic IOL implantation which involves implanting a lens behind the cornea, but in front of the iris. With this new option, many of those who were too highly nearsighted for LASIK are now candidates for refractive surgery.

If you are interested in refractive surgery, please let us know. Refractive surgery is not to be taken lightly. Detailed testing is necessary to determine whether or not you are a good candidate for the surgery. If testing shows you to be a good candidate, we can help you choose the refractive surgeon who is most appropriate for your case. In addition, we provide post-operative care for refractive surgery.

Our doctors are proud to recommend the surgeons at Missouri Eye Institute for the latest in refractive surgery techniques and technology. Missouri Eye Institute is the first practice to offer bladeless LASIK in Southwest Missouri. The surgeons at MEI are all highly skilled and their patient care is second to none.
